

The Idaho Observer

The Most Important Issue of 2013

Compiled By: Anne Wilder Chamberlain

Global geo-engineering programs have been ripping the climate system apart for over 60 years, with an all out ramp up of the programs in the last decade and a half. Unfortunately, as of 2013, the biosphere is unraveling and the geo-engineers are fueling the fire. Although there are countless sources of damage to the climate system, global geo-engineering should be considered the single greatest destructive factor of all.

What is geo-engineering? Aboutthesky.com states, "Geo-engineering is defined as the large-scale manipulation of the earth's environment to suit human needs and 'promote habitability.' Once a controversial field, scientists around the world are now recruited and paid to develop methods of geo-interference to affect our climate and topography in the effort to mitigate the current 'global warming crisis.'"

The mainstream media and its funders would have us believe that our planet needs to be cooled because the CO² they claim we have been so carelessly creating by burning fossil fuels is warming the planet and destroying the protective layer of ozone above us. Therefore, although the United Nations banned weather operations for purposes of warfare in 1978, worldwide programs experimenting with the creation and manipulation of man-made "cirrus clouds" have been ongoing, with the supposed purpose of combating "climate change."

In an interview on May 23, 2006, on *KNBC Channel 4* news, with Department of Energy (DOE) scientist Gregory Benford, Paul Moyer remarked: "It's called geo-engineering. Fighting global warming by putting a chemical dust in the atmosphere."

Benford replied, "You've got to ... engineer all these, so you get the right kind of clouds, with the effects we want. You could use barium oxide, which makes big fluffy clouds. You could use tiny little bits of aluminum, which is benign in the environment, and essentially manage the climate."

Except, aluminum isn't benign in the environment. It is as much a poison to plants as it is to people. Because of poor crop yield in heavily sprayed areas like California, Monsanto is even attempting to geo-engineer aluminum-tolerant crops. In many regions, whole forests are in steep decline.

Soil and drinking water samples all over the country are recording aluminum and barium readings at highly toxic levels – off the charts. Residents of Arizona and Northern California have paid for laboratory testing of environmental samples and are now approaching local officials with the results.

If acknowledged at all, they are told that experiments with deflecting sunlight are to our benefit. They are told that the "global dimming" phenomenon, now being admitted to by NASA as a consequence of the haze layers formed by what it calls "persistent jet contrails," will serve to cool the planet.

But actually, surrounding the earth with reflective metals is the equivalent of covering a baking potato with tin foil. The polymer fibers also con-

tained in the aerosols trap heat and seal it in. They also trap atmospheric moisture, preventing rain.

The question we might ask is, "Are scientists playing with the weather ostensibly to help us, when the real plan is to *create* or exacerbate 'global warming' so that we will then beg for a man-made way out of what looks like unstoppable 'climate change'?"

So, how bad can it get? Just when it seemed the negative news surrounding global geo-engineering could not get any worse, it is. We have known for some time that the UV levels were getting rapidly worse due to the ongoing atmospheric spraying. Anyone that is even slightly awake and aware has noticed that the sun feels incredibly intense on the skin. Most varieties of plant life are showing signs of stress in most areas of the country. And it's getting worse by the day.

Although extreme drought and toxic rains - due in large part to the heavy metal fallout from geo-engineering - are taking their toll, recent metering of UV levels in Northern California indicate that there is an element in this die off that is far worse than we had realized, an incomprehensibly high level of UV radiation.

On top of that, the geo-engineers threw everything they had at the Arctic in late July. The cooling anomaly they created and which the media hyped up, has now totally imploded. The damage done from decades of playing God with the weather cannot be undone and will only be made exponentially worse the more they try to hide it with ever increasing geo-engineering assaults. All their manipulation and spraying may have created a short term cooling at the cost of a much worsened situation overall. Now we see the results, the Arctic ice implosion is in uncharted territory. The melt

rate is virtually in "free fall". It is very likely we will have an "ice free" Arctic this year or next. And the media is completely ignoring this issue in spite of the extremely dire ramifications for all life on earth.

As the ice goes, the Arctic's methane hydrate deposits are completely letting loose. Methane is now acidifying the oceans and saturating the atmosphere. The ozone layer is being decimated, and the toxic fallout from the spraying continues to poison all life on earth day in and day out.

The worst part of this is the funding for geo-engineering comes from annual defense spending bills and elected officials are deliberately kept in the dark on projects conducted by defense intelligence agencies. The Pentagon hires private contractors and corporations to assist with the spraying of these chemicals, so there is absolutely no oversight from congress. The CIA and NASA are now backing the National Academy of Sciences in regards to geo-engineering projects.

It's up to all of us to help bring this critical issue to light. Get up to speed on the facts, arm yourself with credible data, and help us get the word out.
